# FACTORS IN THE REGIONAL RETENTION OF GRADUATES FROM HEALTH AND SOCIAL SERVICES PROGRAMS 

# Results of the 2019 and 2020 Surveys of Health and 

 Social Services Career Program Students at English Colleges in QuebecConstance Crossland and Douglas Brown

John Abbott College

April 27, 2021

## Acknowledgements

The project "QUÉBEC AND REGIONAL RETENTION PLANS - A SURVEY OF HEALTH \& SOCIAL SERVICE GRADUATES FROM ENGLISH CEGEPS" was funded by the Le Secrétariat aux relations avec les Québécois d'expressions anglaise through a grant to McGill University. Without the cooperation, support and efforts of the people listed below, this project could not have been carried out. The team at John Abbott is most grateful.

## At Dialogue McGill:

- Daniel Weinstock, Principal Investigator
- Mireille Marcil, Director
- Jean Robert, Senior Advisor for Partnership Development

## At John Abbott College

## Project Managers

- Joanne Ross, Manager of Academic Support
- Dr. Douglas Brown, Dean of Technologies

Survey Design

- Joanne Ross, Manager of Academic Support
- Nathalie Prévost, College Development Office
- Lisa Boyle, College Development Office
- Douglas Brown, Dean of Technologies

Obtaining authorization and cooperation of the other colleges, and running the surveys:

- Lisa Boyle, College Development Office
- Douglas Brown, Dean of Technologies
- Joanne Ross, Program Deans' Office
- Diane McGee, College Development Office
- Gordon Brown, Academic Dean
- John Halpin, Director General
- Constance Crossland, College Development Office

Data Analysis

- Constance Crossland, College Development Office

Production of the interim and final reports:

- Constance Crossland with Douglas Brown

Thanks to the following people at their respective colleges who sent the surveys to their students, collected the results and then sent them on to John Abbott.

- Jennifer McLeod, Champlain-Lennoxville College
- Diane Wintle, Champlain-Lennoxville College
- Sam D'Amico, Champlain-St.Lambert College
- Robert Larouche, Champlain-St.Lambert College
- Kinga Breining, Dawson College
- Katherine Mcwhaw, Dawson College
- Annie Aubertin, Heritage College
- Sarah Gutman, Heritage College
- Laurentiu Luca, Heritage College
- Kelly McMahon, Heritage College

The following people notified the students in their respective programs of the on-line access to the survey.

- Susan Campbell, Vanier College, Special Care Counselling
- Antoinette Cocciola, Vanier College, Nursing
- Patricia McClurg, Vanier College, Respiratory \& Anesthesia Technology

Thanks to Jeschua Nordin at Skytech for the duplication of the surveys on the participating colleges servers.

## I. Executive Summary

## Background

Providing health care and social services to the English-speaking population of Quebec in English is a responsibility of the Quebec Government. Le Secrétariat aux relations avec les Québécois d'expression anglaise engaged Dialogue McGill, a part of the Institute for Health and Social Policy at McGill University, to look for ways to improve access to these services, as well to increase the retention of graduates of relevant programs at English Colleges in Quebec. Dialogue McGill contracted John Abbott College to carry out research on opinions of current students to determine their plans for location of work once they complete their studies, the reasons that influenced their choice of where to locate after graduation and the factors that could persuade them to work in a region of Quebec outside of the Census Metropolitan Area of Montreal (Montreal CMA) ${ }^{1}$. Work on fulfilling this contract began in 2017. It had various stages and involved the efforts of a number of people. This report only deals with the final stage, which was to survey students in various health and social career programs at English Colleges in Quebec over a two-year period.

## Methodology

With the cooperation of individuals at each college, data was collected from two surveys that were carried out at the six English Colleges in Quebec that offer relevant programs ${ }^{2}$. The colleges also provided the enrolment numbers for the programs offered at their institutions.

Two essentially identical surveys were run, once in the spring of 2019 with five colleges, and once again in the spring of 2020 with all six colleges. ${ }^{3}$ The results were collected, coded and analyzed at John Abbott College. The benchmark of $60 \%$ response rate was achieved.

Each year's data set was looked at separately in several ways, and compared to look for significant differences; none were found. Because of the large differences in program enrollments, it was decided that the most useful way to look at the results was to divide the programs into "Nursing", "Other Health Care" and "Social Services". This produces more equal group sizes and increases the internal validity of the data. Moreover, to reduce any anomalies that could arise in very small programs and increase validity, the data from both surveys was combined.

At the same time, it is important to note that the different results for individual colleges and programs need to be taken into account because there can be significant variation in the responses and data from different programs, including among the programs within the three main groupings of "Nursing", "Other Health Care", and "Social Services". Specific program and college results can point to different regional, program, and disciplinary realities.

## Description of Respondents

Though no demographic data were collected directly, knowing the program and college in which the respondents were registered, their permanent address, their main language, how close they were to graduation and their reasons to have chosen to attend an English-language college provides a picture of the respondents. The

[^0]participating colleges provided program enrolment numbers, and the location of each college is known, but there is no independent verification of the declarations of the survey respondents.

The data show that nursing programs have over $40 \%$ of the enrollments, while the other health care programs and social services programs are each roughly $30 \%$ of the total, with some individual programs representing as few as $2 \%$ of the totals of students surveyed and who responded.

There is very little movement from respondents with a permanent address in the Montreal CMA to other areas of the province to attend college, but a significant number of respondents from outside the Montreal CMA come to Montreal colleges. If they wish to study in English there may be no choice, because the program they want is not available in their region in English. Though they are studying at an English college, about 15\% of respondents have French as both their main language and the language they use most in their daily life. Fourteen percent (14\%) of respondents say their main language is other than French or English; most of these respondents say English is the language that they use in their daily lives.

Finally, for the social services and "other health care" programs, the two most common reasons to choose to study at an English college are for the programs and course offerings and the opportunity to study in English. For respondents in nursing programs, this is reversed, though not because nursing has more French or "other" respondents; it may be because the nursing program is offered in two colleges outside of the Montreal CMA.

For the aggregate of respondents, linguistic and culture identity and proximity are significant factors as well.

## Post-Graduate Plans of Respondents

Ninety-six percent (96\%) of nursing and other health care programs' respondents plan to work in their fields after completion of studies. In the case of the social services programs' respondents, $79 \%$ do, while $17 \%$ are unsure.

Overall, $69 \%$ intend to go on to university studies, but the rates are different depending on the program category, nursing being the highest and other health care the lowest. Eighty-six percent (86\%) of those intending to pursue further studies plan to enroll in Quebec universities.

Following the completion of their studies, the majority ( $56 \%$ ) say they want to work in the Montreal CMA, with $18 \%$ being unsure. Only $12 \%$ plan to work in another region of Quebec, though a greater percentage of Frenchspeaking respondents than other language groups do. Overall, $14 \%$ already plan to leave the Province for work. By category, nursing has the greatest percent of respondents who plan to leave Quebec. Further, about the same percentage of English and French-speaking respondents intend to leave. Again, responses to these questions vary by program category.

## Factors that Influence Post-Graduate Plans

The top two reasons chosen by respondents for why they chose where to work are "Family and friends", and "Opportunity for employment". "Closer to home" was third. Language proficiency ranks sixth out of the eight offered reasons. For the respondents who say they plan to leave Quebec for work, "Language proficiency" is the number one reason, with "Possibility of employment" being second. This might suggest that providing supplementary French as a Second Language support that would enable students to improve their proficiency in French as well as raising awareness about employment opportunities, and encouraging proactive hiring practices with regard to the English-speaking minority in Quebec could have a positive impact on retention of graduates. For those who plan to remain in Quebec, "Family and friends" and "Closer to home" rank first and second, and this is independent of whether they chose the Montreal CMA or another region of Quebec. Program category and main language of the respondents have less of an effect on students' choices of where to work.

When questioned about the factors that could encourage working in an area of Quebec outside the Montreal CMA, the top two are "Possibility of employment" and "Financial reasons". The fact that motivations such as
"Community", "Nature", "Culture," and "Lifestyle" are less frequently cited may point to opportunities to raise awareness about living outside the Montreal CMA among students who are not familiar with non-metropolitan regions. In order to make sense, the data from this question needs to be separated into those who do not have a permanent address in an area of Quebec outside the Montreal CMA (i.e., those in the Montreal CMA plus those from outside Quebec) from those who do. The first group needs to want to move to a region; the second group needs to be persuaded not to leave. The question of what is meant by "an area of Quebec outside of the Montreal CMA" remains unclear, as there are many different areas, some more far-flung than others.

Seventy percent (70\%) of respondents indicated that they were willing or might be willing to consider establishing themselves outside of the Montreal CMA. These results vary by the permanent address of the respondent; there is a much higher degree of willingness in respondents who already live outside the Montreal CMA than in it. Again, it is not clear how the respondents with a permanent address in a region outside of Montreal CMA interpreted this question.

## Self-Assessment of Respondents' Skills in French

Comfort with remaining in Quebec, especially in a region outside the Montreal CMA, is related not only to the work environment but also with all aspects of daily life in the surrounding society. Survey question 8 focused on the language skills needed to function adequately in the workplace, but these bear upon the rest of life as well.

On average, respondents rate their skill level in written French lower ( $70 \%$ strongly agree + agree that it is adequate) than spoken French (83\%) and reading French (87\%). Here the results for francophones, anglophones, and speakers of other languages will need to be distinguished. Naturally, those having French as their main language are much stronger than those with English or "other", but written French is still weaker among francophones than the spoken or reading skills.

With variations by individual program, these trends hold true across the nursing and other health care program categories, with the social services program category being somewhat lower in the skill levels. The only significant difference in skill levels cross-tabulated with permanent address is with those who come from outside Quebec. Further, estimation of the adequacy of skill levels increases a little in those closer to completing their program.

Because it is built into their DEC programs of which all respondents have completed at least one year, a large majority have taken at least one French Second Language (FSL) course, at a level appropriate to them.

All of this indicates that, by their estimation, the language skills of a majority of respondents of the programs surveyed are adequate for them to work anywhere in Quebec, though the more pertinent data concerns the significant minority of respondents whose French is weaker.

## Conclusions

The main purpose of this research was to find the factors that would increase the retention of the graduates to health and social service career programs from Quebec's English colleges and encourage them to accept employment in regions of Quebec outside the Montreal CMA.

The majority of respondents want to work where they currently live; recruiting and supporting students from regions of Quebec outside the Montreal CMA into programs that are structured to minimize their time away from home could increase the number of workers in health and social services institutions available to serve the Englishlanguage community there and to contribute to its vitality.

There are also a number of respondents that either plan to leave Quebec for work or are unsure of where they wish to work. The main reasons for the choice of where to work are "family and friends" and "possibility of employment". However, the factors identified by respondents that might persuade them to remain in Quebec are
largely economic: jobs and financial reasons. Raising awareness about other less frequently identified factors may have a currently unrealized persuasive potential.

For those already in living in Quebec where there is a shortage of health and social services workers in English, the problems are likely not jobs in general, but jobs that pay well enough to be competitive and/or jobs in a place where they want to live. Programs that encourage students to do internships in other regions of Quebec through the provision of professional, personal, linguistic and financial support could help the graduates to be more comfortable with seeking or accepting employment there.

## II. Introduction

The 2016 Canadian Census reported that 1,103,475 (13.7\%) of the population of Quebec claim English as their first official language spoken, while 718,985 (8.9\%) have English as their mother tongue and 372,450 (4.6\%) have a knowledge of English only. ${ }^{4}$ These represent a significant portion of the population of Quebec.

Dialogue McGill is part of the Institute for Health and Social Policy at McGill University and has as its purpose to explore ways to improve the training and retention of health professionals in Quebec in order to better serve the English-speaking population of Quebec.

Dialogue McGill contributes to Quebec's initiatives to "ensure that English-speaking Quebecers have access to the full range of health and social services in their own language through measures designed to build and maintain a sufficient complement of health and social services personnel capable of providing services in English. The project is an additional tool to support the implementation and enhancement of regional programs of access to public health and social services in English as provided for in the Act respecting health and social services." ${ }^{5}$ Its motto is "Better communication for better care."

Dialogue McGill has two overall objectives:

- To provide language training and retention initiatives so that public health and social service professionals have opportunities to improve their ability to provide services in English and to practice where they can meet the needs of the English-speaking population of Quebec.
- To promote research and information sharing on approaches to reducing barriers to public health and social services access for English-speaking Quebecers.

Le Secrétariat aux relations avec les Québécois d'expression anglaise engaged Dialogue McGill to explore ways to promote access to government services and programs for English-speaking Quebecers, as well as to contribute to the retention of young English-speaking Quebecers through improved employability.

As one of the initiatives in pursuit of this mission, Dialogue McGill contracted John Abbott College to conduct surveys of current health and social services students at the English-language colleges that offer career programs in these fields. ${ }^{6}$ The areas that this research hoped to elucidate were
(1) the post-graduate plans of these students,
(2) the factors that influence their choices of what to do and where to live after the completion of their diploma program, and
(3) self-assessment of their French language skills viz à viz being adequate to work in Quebec following completion of studies.

[^1]
## III. Survey Plan and Methods

The idea of using a survey to determine the intention of graduates of health and social services programs at English-language colleges grew from a survey conducted at John Abbott College in the fall of 2017. This survey was entitled " 8 Easy questions about where you plan to live and work upon the completion of your studies", and was sent to all John Abbott students in all programs. It used some different questions, defined "home" in another way and used different lists of motivating factors. However, it functioned as a template and was seen to suggest wider utility.

The current project was submitted in the fall of 2018 for 2018-2020 in the area of "Research on Motivation of English-Speaking Youth to Stay in Quebec" and was entitled, "Quebec and Regional Retention Plans - A Survey of Health \& Social Service Graduates from English CEGEPS". It proposed to modify the survey done previously at John Abbott, expand it to include all the relevant English-language colleges in Quebec, and narrow it to include only those students in health and social service career programs. The specific plan for the research was to create a modified survey and run it twice, once in the spring of 2019 and then again in the spring of 2020. It would survey all students registered in all years of the programs selected ${ }^{7}$.

The proposal was accepted in January 2019. The contract was to run from April 1, 2019 until March 31, 2020; it was later extended to October 31, 2020.

First, the programs and colleges to be included in the survey were identified. There are currently six Englishlanguage colleges in three regions ${ }^{8}$ of Quebec offering one or more of the thirteen programs included in the study. (See Figure 1, next page)

Note from this figure that of the six English colleges offering the programs included in this study, that four of them are in the Montreal Census Metropolitan Area (Montreal CMA), that all of the colleges offer the Nursing Program, and that eleven of the thirteen programs are exclusively offered in the Montreal CMA in English. The only programs that are offered outside the Montreal CMA in English are Nursing and Special Care Counselling.

Next, based on the three research areas described in the introduction, survey questions were developed and finalized by investigators at John Abbott College. The same survey questions were used in both years ${ }^{9}$.

It was decided to survey all the students registered in each program in the Winter 2019 and Winter 2020 semesters, be they in their first, second or third year of the program. Therefore, up to two-thirds of the respondents to the 2020 survey could have been answering for the second time; however, since the survey was anonymous and no question asked about this directly, the number that might have answered twice cannot be determined.

[^2]Figure 1 - Colleges, Programs and Regions

| Nursing (180.A0) | Estrie |
| Champlain-Lennoxville | Montreal CMA |
| Champlain-St. Lambert | Montreal CMA |
| Dawson | Outaouais |
| Heritage | Montreal CMA |
| John Abbott <br> Vanier | Montreal CMA |
| Nursing Intensive (180.A1) <br> John Abbott | Montreal CMA |
| Paramedic Care (181.A0) | Montreal CMA |
| John Abbott | Montreal CMA |
| Physiotherapy Technology (144.A0) <br> Dawson | Montreal CMA |
| Radiation Oncology (142.C0) | Montreal CMA |
| Dawson | Mespiratory \& Anaesthesia Technology (141.A0) |
| Vanier | Montreal CMA |
| Social Service (388.A0) | Mawson |
| Special Care Counselling (351.A0) <br> Champlain-Lennoxville <br> Heritage <br> Vanier | Mohn Abbott |

Since all the colleges in the study use Omnivox, a pedagogical management system created and operated by Skytech Communications ${ }^{10}$ and used as an on-line interface with their students, it was decided that the most efficient and consistent way to administer the surveys was to use the survey module in Omnivox. Skytech agreed to duplicate the survey directly on the servers at each of the colleges. The implicated colleges were contacted and consent for the research was obtained from the research ethics boards at Champlain-Lennoxville College, Champlain-St. Lambert College, Dawson College, Heritage College and John Abbott College. Vanier College's Research Ethics Board expressed concerns about the process of notifying the students, and the first survey, which was carried out from May 7, 2019 to May 21, 2019 using the Omnivox survey module proceeded without Vanier's participation. The 2019 survey data was collected at each college and sent on to John Abbott.

The second survey was planned to run from April 27, 2020 until May 29, 2020, but the exigencies of the Covid-19 pandemic delayed implementation at some colleges. However, in all cases, the participants had the same thirty-

[^3]three day time-period to complete the survey. Additionally, a method that Vanier College's Ethics Review Board could agree to was found that allowed the participation of Vanier College's students ${ }^{11}$.

In the spring of 2020, the relevant programs at Dawson College, John Abbott College, Champlain CollegeLennoxville and Champlain College-St. Lambert were surveyed from April $27^{\text {th }}$ through May $29^{\text {th }}$ as planned. The survey of the programs at Heritage College ran from May 13, 2020 until June 10, 2020. At Vanier, the Special Care Counselling program students were notified of the survey on May 6, 2020; data was collected until June 6, 2020. Vanier's Respiratory \& Anesthesia Technology students were sent a link to the survey on May $1,2020^{8}$ and data was collected until June 19, 2020. Vanier's Nursing Program students were sent a link to the survey on May 22, 2020 and data was collected until June 23, 2020.

The John Abbott College data and the Vanier College data were already on the John Abbott College's web servers and therefore were available as soon as the surveys closed. In order to ensure the security of the data from the other colleges, USB data keys were sent to them by courier and they were asked to load and password-protect the data, and return them to John Abbott College. The passwords were sent by separate emails.

Each college provided the total numbers of registered students in each of the programs that they offered in the Winter 2019 and Winter 2020 semesters.

After the data from 2019 was collected at John Abbott College, it was partially analyzed and an interim report was submitted to Dialogue McGill on September 30, 2019. A progress report on the 2020 survey was sent to Dialogue McGill in June 2020.

Complete data from the 2020 survey was only available at John Abbott on June 24, 2020. In both years of the survey, the data obtained were identified by year, college and program and then combined. Survey respondents who did not answer the first question (Which health or social service program are you currently registered in?) were eliminated from the data. Then data analysis and the construction of the report began. Each college retained (or could be sent) copies of their own data, so faculty, program coordinators and deans have the opportunity to compare their individual programs to the aggregated data found in the report.

[^4]
## Summary of Survey Plan and Methods

- The study included the six English-language colleges that offer at least one of the designated programs.
- The cooperation of the colleges implicated in the study was secured.
- Colleges are located in three regions of Quebec.
- There are four colleges in Montreal CMA.
- There are two colleges in Quebec outside the Montreal CMA.
- The surveys covered 13 health care and social services programs in total.
- All 13 programs are offered in Montreal CMA colleges in English.
- Eleven programs are offered only in Montreal CMA colleges in English.
- All colleges offer Nursing.
- Two programs are offered in both colleges outside the Montreal CMA in English (Nursing and Special Care Counselling).
- One college in the Montreal CMA gives Special Care Counselling,
- All programs lead to a DEC.
- All programs are normally three-years in duration, except Intensive Nursing, which is 24 months.
- The surveys were conducted using Omnivox or LimeSurvey.
- Many but not all of the conditions were the same for both years:
- Same programs (except no Respiratory \& Anaesthesia Technology in 2019)
- Same questions (except for a refinement of the question on the last level of French studied)
- Same time period, though not the same dates in year two
- Five colleges in the first year; one additional college in the second year
- Five colleges used the same survey tool
- All students in all years of each program were invited to respond to the survey.
- Data was aggregated, coded, analyzed and reported at John Abbott College.

## IV. Response Rates and Validation of Survey Data

This section aims to determine if the survey data is internally consistent and valid, and to decide the best method to aggregate the data obtained. ${ }^{12}$ To do this, we will first look at response rates overall, by college, by program and by program category. Needed are response rates that are sufficiently high and representative to allow useful information to be extracted from the data.

One benchmark of success in the research was to achieve a $60 \%$ response rate overall. This was accomplished, as shown below, with similar response rates of $59 \%$ for 2019 and $61 \%$ for $2020 .{ }^{13}$ In addition, when the Vanier students in the 2020 survey are removed, almost the same total number of students (1807 \& 1802) were registered in both years that the surveys ran.

Figure 2 - Summary of Response Rate Data by Year

| Category | n |
| :--- | ---: |
| Registered students surveyed in 2019 (no Vanier students); all three years | 1807 |
| Registered students in 2020 including Vanier students (all three years) | 2251 |
| Registered students in 2020 (excluding Vanier students); all three years | 1802 |
| Registered Vanier students in 2020 | 449 |
|  |  |
| Responses in 2019 (rate = 59\%) | 1060 |
| Responses in 2020 (rate = 61\%) | 1379 |
|  |  |
| Total registered both years (potential respondents) | 4058 |
| Total actual respondents both years | 2439 |
| Average response rate, both years | $60 \%$ |

When interpreting the results, readers should keep in mind that a response rate of $60 \%$ is less than the $85 \%$ often recommended to allow confident generalization of survey findings to the entire target population for small groups. ${ }^{14}$ If taken individually, the number of respondents in some of the programs included in the surveys is quite small, especially if a survey's numbers are considered by program one year at a time. This suggests that individual program results, which are available to individual colleges, while they do point to realities particular to a program or college, should be interpreted by program coordinators and college administrators with this small-sample limitation in mind.

The variation in response rates at different colleges shown in Figure 3 (following page) may be due to several factors, including the use of two different survey tools with a different method of notification, the different number of reminders that may have been sent, and the fact that in March 2020 classes were moved on-line at

[^5]different dates. In addition, the crisis created by the Covid-19 pandemic may have had special implications for students in certain health care programs. However, the overall response rate met the target of 60\%.

Figure 3-Response Rates by College

| College | Total Registered <br> Students | Total Survey <br> Responses | Response rate by <br> college |
| :--- | :---: | :---: | :---: |
| Champlain-Lennoxville | 311 | 215 | $69 \%$ |
| Champlain-St. Lambert | 193 | 120 | $62 \%$ |
| Dawson | 1646 | 946 | $57 \%$ |
| Heritage | 288 | 136 | $47 \%$ |
| John Abbott | 1171 | 819 | $70 \%$ |
| Vanier | 449 | 203 | $45 \%$ |
| Total/ Average | $\mathbf{4 0 5 8}$ | $\mathbf{2 4 3 9}$ | $\mathbf{6 0 \%}$ |

When response rates are examined by program (Figure 4), differences are revealed, though there is consistency between the percentages of the total registered by program and the percent of the total responses by program, making the respondents representative of the population of registered students as a whole.

What this also highlights is the disproportionate number of registrations and responses that come from the Nursing programs; they make up over $40 \%$ of the total and would skew the outcomes if lumped in with all the others.

Figure 4 - Response rates by Program

| Program | Total <br> Registered Students by Program | Total Responses by Program | Program Response Rate | \% Registered Students by Program | \% of Total <br> Responses by <br> Program |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Biomedical Laboratory Technology (140.C0) | 149 | 98 | 66\% | 4\% | 4\% |
| Community Recreation Leadership Training (391.A0) | 198 | 100 | 51\% | 5\% | 4\% |
| Dental Hygiene (111.A0) | 190 | 142 | 75\% | 5\% | 6\% |
| Diagnostic Imaging (142.A0) | 184 | 109 | 59\% | 5\% | 4\% |
| Nursing (180.A0) | 1672 | 1056 | 63\% | 41\% | 43\% |
| Nursing Intensive (180.A1) | 139 | 60 | 43\% | 3\% | 2\% |
| Paramedic Care (181.A0) | 195 | 145 | 74\% | 5\% | 6\% |
| Physiotherapy Technology (144.A0) | 178 | 103 | 58\% | 4\% | 4\% |
| Radiation Oncology (142.C0) | 82 | 51 | 62\% | 2\% | 2\% |
| Respiratory and Anesthesia Technology (141.A0) | 72 | 31 | 43\% | 2\% | 1\% |
| Social Service (388.A0) | 333 | 196 | 59\% | 8\% | 8\% |
| Special Care Counselling (351.A0) | 456 | 206 | 45\% | 11\% | 8\% |
| Youth and Adult Correctional Intervention (310.B0) | 210 | 144 | 69\% | 5\% | 6\% |
| Grand total students | 4058 | 2439 | 60\% | 100\% | 100\% |

Figure 5 (following page) is a useful illustration of this and suggests that Nursing should be considered separately from the other programs. Whether by the number of registrations or the number of responses, it swamps the other programs.

Figure 5-Registrations and Responses by Program

To compensate, it was decided to combine certain programs other than Nursing into two separate categories. Nine of the 13 programs covered in the survey are in the health care category, while the remaining four are considered social services. ${ }^{15}$ If the programs are split into the three categories shown in Figure 6, the disproportion between Nursing and the other programs is reduced, grouping them for more appropriate comparison because it converts them to members of a group that is not small and produces more reliable information. It will still allow faculty and college administrators to compare the results from individual programs to overall results for different program categories.

Figure 6-Registrations and Responses by Category ${ }^{16}$

[^6]Figure 7 illustrates that the distribution of responses by program category provides more equal representation.
Figure 7 - Distribution of Responses by Program Category ${ }^{17}$

Figure 8 illustrates the response rates for the categories, as well as the average of $60 \%$.
Figure 8 - Response Rates by Category ${ }^{18}$

Given that there were variations in the conditions, the delivery methods, and the populations surveyed from 2019 to 2020, it is fair to ask if the results used in answering the basic questions that the surveys were designed to examine will produce reliable information.

The results for each survey year were compiled separately for each question in Appendices B, C ( 2020 with Vanier's data) and D (2020 without Vanier's data) of this report and then with all data combined in Appendix E. These were compared as shown in Appendix F. This shows a high degree of consistency among the surveys, which indicates that the 2020 Survey validates the results of the 2019 Survey. ${ }^{19}$ It further argues for using the aggregated data for the analysis of the survey questions because a larger data set will tend to reduce the effects of any anomalies in programs with small enrollments while also allowing the results of any given program to be put in the context of its overall program category.

Aggregated data will be used in the remainder of the report.

[^7]
## Summary of Response Rates and Validation of Survey Data

- There were 4058 potential respondents to the two years of the surveys.
- There were 1807 students registered in the programs surveyed in 2019.
- There were 2251 students registered in the programs surveyed in 2020.
- There were a total of 2439 respondents to the surveys in both years, so the benchmark of a $60 \%$ over-all response rate was achieved.
- Comparison of the data from 2019 with 2020 individually, both with and without the inclusion of that from Vanier College, with all the data from both years shows a high level of agreement and justifies using the combined data.
- The survey data is valid with several caveats.
- It is likely that some students answered the survey twice, but none of those respondents were in the same place in their program the second time as the first, and their answers might well have changed with their greater degree of experience.
- Response rates varied by colleges and programs, but the aggregated results are consistent when compared year by year. This suggests that it is reasonable to consider generalizations of the aggregated results to the respondents as a whole, remaining mindful both that there could be distortions when the data are separated into small fractions and that the data by individual programs remain relevant for an understanding of the results for those programs.
- Given that the Nursing program is by far the largest program by registration numbers and response rates, it may have the effect of skewing the results. It is reasonable to separate the Nursing Program responses from the other health care programs.
- Separating the aggregated data into three program categories (Nursing, Other Health Care, and Social Services) produces more equal-sized data groups and will be the main classification used in the rest of the report.

## V. Description of the Respondents

By design, the surveys gathered information in an anonymous fashion without any demographic data being automatically collected. Therefore, we have no information on the potentially relevant variables of gender or age of the respondents, nor any way to verify claims about residence, language or status in a program. However, in addition to the program data given in the previous section, we do know other characteristics that will provide a partial picture of the respondents, including, among others:

- the category of the program (nursing, other health care or social services),
- their declared permanent addresses,
- the colleges that they are attending and the location of those colleges,
- their reasons for attending an English-language college,
- their declared main language,
- the language in which they claim they conduct their daily lives, and
- whether or not they believe they are close to graduating from their program.

As we saw in the previous section, there are nine programs in the health care category (one of which is Nursing) and four in the social services area; they constitute the total of the respondents as show in Figure 9. These significantly varying percentages are proportional to the registrations in the programs.

Figure 9 - Survey Respondents by Category ${ }^{20}$ (Q1)

## Where Respondents Live

As shown in Figure 10, the majority of the respondents declare their permanent address to be in the Montreal CMA.

Figure 10 - Permanent Addresses of Survey Respondents ${ }^{21}$ (Q11)

[^8]Next, the permanent addresses of respondents were separated by program category. The higher percentage of respondents for Nursing and Social Services for "In Quebec outside the Montreal CMA" shown in Figure 11 is likely a function of the fact that Nursing and Special Care Counselling are offered in the regions of Quebec outside the Montreal CMA, as well as in the Montreal CMA. To study any of the other health care programs in English, you must come to the Montreal CMA. ${ }^{22}$ For practical or financial reasons, this may discourage some people from enrolling in programs where this would be necessary. This suggests that financial support for students from the regions, as well as proactive recruitment outreach, could encourage potential students from the regions to enroll in Montreal-based health care programs.

Figure 11 - Program Category Cross-tabulated with Permanent Address (Q1 x Q11) ${ }^{23}$

Looked at from the point of view of where the respondents live, Figure 12 shows the distribution of program categories by the permanent addresses of the respondents. It is clear that Montreal-based non-nursing health care programs have a significantly lower number of students from outside the CMA.

Figure 12 - Permanent Address Cross-tabulated by Program Category (Q11 x Q1) ${ }^{24}$

Figure 13 shows the general distribution of the students registered in the health and social services programs studied in the survey by the location of the college at which they are enrolled. Note that the percentages of

[^9]students registered in Montreal CMA colleges and the number of respondents from these colleges correlate well, and that there is an $11 \%$ difference in the number of students registered in Montreal CMA colleges and the number with the Montreal CMA as their permanent address. This indicates that a significant number of students from outside Montreal do choose to attend Montreal-based programs.

Figure 13-Registrations and Responses by Permanent Address and Region of College ${ }^{25}$ (Q1 x Q11)

Given that eleven of the thirteen programs in the study are offered in English only at Montreal CMA colleges, it is not surprising that $85 \%$ of the registered students are attending Montreal CMA colleges, even though only $74 \%$ actually live there.

Looked at another way, if you extract the 563 respondents who declare a permanent address in Quebec outside of the Montreal CMA and cross-tabulate them with the location of the college they are attending, you see that $50 \%$ (284/563) of them are enrolled in Montreal CMA colleges. Conversely, only 41 out of 1764 respondents ( $2.3 \%$ ) with a permanent address in the Montreal CMA are enrolled in the colleges in the regions of Quebec outside of the Montreal CMA. ${ }^{26}$ There may be recruitment opportunities here for colleges in other regions of Quebec, since Montreal-based colleges are not able to accept all applicants to their programs, including in particular, anglophone applicants who may be unaware of programs available there, and opportunities for colleges in other regions to establish health care and social services programs that might attract students from their own or other regions, including from the Montreal CMA.

Since program category is being used as a main classification, it is useful to break down registrations in these categories by the location of the college where they are offered as well. Figure 14 seems to show that when programs exist in English Colleges outside the Montreal CMA, students will indeed choose them, as is clear with Nursing.

[^10]Figure 14 - Program Category Registrations by Region of College ${ }^{27}$

Figure 15 looks at the relationship between permanent address and the population of students in the two regions outside of Montreal CMA for the two programs given there. As expected, the majority of students who are studying there also live there, though $12 \%(25 / 209$ and $16 / 131)$ in each have come from the Montreal CMA. It is worth noting that, at least among the survey respondents, regional nursing programs also draw $9 \%$ of their students from outside the province, another potential source of graduates who might establish themselves in the regions.

Figure 15 - Permanent Address of Respondents for Programs in Colleges Outside of Montreal CMA Only ${ }^{28}$

## Expectation of Graduation within Six Months

As shown in Figure 16, an average of $27 \%$ of respondents expected to complete their program within six months. These are three-year programs, and this $27 \%$ suggests that the response rates of first and second year students, and students completing the final year of their programs might be roughly distributed, with attrition accounting for fewer students in their final year. ${ }^{29}$ (Given that the surveys were run in the spring, for the 2019 survey, that would have meant graduating in Winter 2019 or Summer 2019. Because in 2020, some surveys ran later than planned, that could include the fall 2020 semester as well.)

[^11]Figure 16 - Percent of Respondents that Expected to Graduate within Six Months by Category ${ }^{30}$ (Q2)

There is very little difference in the expectation of graduation among the categories, though the Social Services is a little higher than in Nursing or Other Health Care.

## Why Choose an English-language College?

As illustrated by Figure 17, the two most frequently cited reasons to choose to study at an English college were for the programs available and the desire to study in English. Linguistic-cultural identity and proximity are also important motivators. Proximity likely speaks to practical and financial dimensions of student choice.

Figure 17 - Reasons to Choose an English-language Cegep ${ }^{31}$ (Q3)

We see in Figure 18 that there is a degree of variation when the program categories are considered individually.
This is a case where Nursing is different from the other categories. The data of nursing program respondents indicates that the most important reason to choose an English college was the opportunity to study in English ( $29 \%$ ), with the programs and course offerings dropping to the second most-chosen reason for them. Other Health Care and Social Services cited "Programs and course offerings" as their top reason. Linguistic and cultural identity, an important motivator across program categories, registers as a motivating factor overall a little more often than proximity.

[^12]Figure 18-Reasons to Choose an English College by Category ${ }^{32}$

Figure 19 shows some variation in the choice of attending an English College when analyzed by permanent address, but the overall trend applies. It is important to keep in mind that the respondents from the Montreal CMA make up 74\% of the total, while those from other regions in Quebec account for 24\%, and from outside Quebec, only 2\%. (The percentages shown are for each geographic area separately and not of the whole.) As well, the populations of the permanent addresses are shown as a percentage of the whole; in reality, there are 1764 respondents with a Montreal CMA permanent address, 563 with a permanent address in another area of Quebec and 54 from outside Quebec.) Program choice and opportunity to study in English are motivators for more students, with proximity again being a slightly less frequent motivator than linguistic and cultural identity.

Figure 19 - Reason to Choose an English College Cross-tabulated with the Region of Permanent Address ${ }^{33}$ (Q3 x Q11)

[^13]${ }^{33}$ Appendix H, Table H2

## Language

Figure 20 compares the declared main language and the language most used in daily activities of the respondents. Given that the respondents whose mother tongue is neither English nor French are students in English colleges, it is not surprising that at this point in their lives most of their activities are carried out in English, which augments the total for "English in daily life". Note that attending an English-language college does not significantly reduce the number of French-main-language respondents who continue to use French as their daily-life language.

Figure 20-Declared Main Language and Most Used Language ${ }^{34}$ (Q6 \& Q7)

In Figure 21 we see the relationship between the main language of the respondents and where they have a permanent address. The percentage of those who claim English as their main language is more than three times higher among respondents from the Montreal CMA than those from outside it. Still, it is noteworthy that almost a quarter of English-language respondents are from outside the Montreal CMA. French-language respondents from parts of Quebec outside the Montreal CMA are a higher proportion of the total number of French-language respondents than the non-Montreal CMA English-language respondents are of the English-language total. This suggests that programs at English-language colleges may be somewhat more attractive to francophones from the regions than to francophones from the Montreal CMA. These non-Montreal CMA francophone graduates of English-language health and social services programs constitute a potential resource for English populations outside the Montreal CMA.

Figure 21 - Declared Main Language Cross-tabulated with Permanent Address ${ }^{35}$

[^14]Another relationship involving language is that of category of program of study chosen and the declared main language. (Figure 22) The distribution of main language across the categories is essentially the same, though the social services programs category is a little higher in percentage of English-language respondents and lower in respondents whose main language is neither French nor English.

Figure 22 - Main Language by Category ${ }^{36}$

When looking at the data for the reasons that respondents chose to attend an English-language college (Figure 23), we see that the "opportunity to study in English" is the most oft-cited reason for respondents with French as their main language, but "programs and course offerings" is the top reason for English respondents as well as for those with neither French nor English as their main language. For English-language respondents, "Linguistic-cultural" identity" is more frequently cited than "proximity" and almost as frequently cited as "opportunity to study in English", indicating a strong affinity for and identification with the English community in Quebec, and a desire to access its institutions.

Figure 23 - Reason to Choose an English-Language College by Main Language ${ }^{37}$

[^15]
## Summary of Descriptive Information

- Program category of respondents
- $43 \%$ Nursing
- 30\% Other Health Care
- $26 \%$ Social Services
- Permanent address of respondents
- 74\% of respondents have their permanent address in the Montreal CMA
- $24 \%$ are from another area in Quebec
- $2 \%$ are from outside of Quebec
- Region of study and permanent address
- $85 \%$ of program students are registered in Montreal CMA colleges and $86 \%$ of respondents are from Montreal CMA colleges
- $98 \%$ of respondents who have a permanent address in the Montreal CMA attend colleges in the Montreal CMA
- $50 \%$ of respondents with a permanent address in Quebec outside of the Montreal CMA are attending a college in the Montreal CMA
- $2.3 \%$ of respondents with a permanent address in the Montreal CMA are attending a college in Quebec outside the Montreal CMA
- Overall, $84 \%$ of respondents are attending a college in the area where they have a permanent address
- Language
- $68 \%$ of respondents claim English as their main language while $82 \%$ of respondents claim English as the language they use most in their daily life
- The increase in percentage of English as language of daily life comes from the "other" category
- Reason to choose an English College
- Overall, and for the "Other Health Care" and "Social Services" program categories, the most often chosen reason to attend an English college is "Programs and Course Offerings", confirming the importance of program offerings as a motivator.
- "Opportunity to study in English" is second, with "Linguistic-cultural identity" being nearly as important for English-language students.
- For respondents in Nursing, the "Opportunity to study in English" is the top reason to attend an English College, and "Programs and Courses Offerings" is second.
- When divided by declared main language, for French-main language, "Opportunity to study in English" is the most important category.

## VI. Post-Graduate Plans of Respondents

By funding this study and others like it, the ultimate goal of the Government of Quebec, the Institute for Health and Social Policy, and Dialogue McGill is to improve access to public health and social services in English in the regions of Quebec as provided for in the Act Respecting Health and Social Services. This can be done though the retention of students studying in health and social service programs at post-secondary level in Quebec and increasing their willingness to live and work outside the Montreal CMA.

Several survey questions asked about the survey respondents' plans for working and living following the completion of their studies, as well as the reasons for their choices.

## Intention to Work in Field of Study after Completion of Studies

As we saw in Section V, an average of $91 \%$ of survey respondents said that it was their intention to work in the field in which they were training after they completed their studies. These rates were significantly higher in nursing and other health care programs when compared with the social services programs. The difference comes from the uncertainty about what to do after graduation being much higher in the social services category than in the others, It will be important for college administrators and faculty to compare levels of uncertainty about plans to work in students' fields of study to the average for this group.

Figure 24 - Plan to Work in Field after Completion of Studies by Category ${ }^{38}$

## Plans for Further Study

Survey question 5 asked respondents about their plans concerning further study after graduation. Sixty-nine percent (69\%) want to go on to university while only $15 \%$ do not, and $13 \%$ are unsure. (Figure 25 )

[^16]Figure 25 - Plans following Completion of Studies (Q4) ${ }^{39}$

The main language of the respondent has some effect on this (Figure 26) with English speakers having a higher rate of intentions to continue on to university and consequently not immediately entering the workforce in the health and social services sectors following college studies.

Figure 26 - Plans following Graduation by Main Language ${ }^{40}$

Considering only the respondents who state that it is their plan to atted university following graduation from college, we see that the intention is not evenly distributed among the program categoies. (Figure 27) The highest rate is among the Nursing Program students (total of $84 \%$ for all universities), who also have a very high rate of intention of working in their field after graduation (96\%). The lowest rate (total of 47\%) is among the other health care programs, with a total of $69 \%$ of respondents in social service programs. These rates, high or low, may have a structural basis, a DEC being the common path to certain university programs (such as Nursing), or there may be no natural university successor

[^17]to the college program. It might also signal contentment with a terminal program, or it could indicate the intention to change career direction after graduation.

Again, taking only the respondents who are planning to attend university and separating them by program category shows that more nursing program students intend to study at English-language universities in Quebec than the other health care or social services students. (Figure 27)

Figure 27 - Plans for Further Study by Program Category ${ }^{41}$

Considering only the 1667 respondents that say they intend to go to university after CEGEP, a large majority (86\%) intend to study in Quebec, either in English (77\%) or in French (9\%), while the other 14\% want to study in English outside of Quebec. ${ }^{42}$ (Figure 28) (Note that none of the respondents said they are planning to attend a Frenchlanguage university outside of Quebec.)

Figure 28 - Respondents' Choice of University

[^18]Breaking this down by the declared main language of the respondents (Figure 29), we see that the majority in every language group plan to attend English-language universities, though there is a significant migration to French-language universities among francophone respondents. Increasing the number of anglophone careerprogram graduates who choose French-language Quebec universities, including universities outside the Montreal CMA, through recruitment outreach and financial support would be a way not only of improving their Frenchlanguage skills, but of enhancing social and workforce integration and improving retention rates of anglophone graduates in Quebec.

Figure 29 - Type of University Cross-tabulated with Main Language ${ }^{43}$

When the respondents' plans for further studies are cross-tabulated with their permanent addresses (Figure 30) we see that a greater percentage of respondents from the Montreal CMA both plan to attend university (71\%) than do respondents from Quebec outside the Montreal CMA ( $66 \%$ ), and that no matter the permanent address, $15 \%$ do not intend to go to university. There are other factors that could well be influencing the choice, such as the type of employment sought or the proximity to a university with an appropriate program, so it is not possible to attribute significance to the differences. However, these findings do suggest that a higher proportion of CEGEP students from outside the Montreal CMA intend to enter the health care and social services workforce immediately after graduation.

Figure 30 - Plans for Further Study Cross-tabulated with Permanent Address ${ }^{44}$

[^19]
## Choice of Location for Work Following Completion of Studies

Survey Question 12 asked the respondents where they would choose to work after they complete their studies. (Figure 31) Remembering that $74 \%$ of respondents have a permanent address in the Montreal CMA, while 24\% live in a region of Quebec outside the Montreal CMA and only $2 \%$ are from outside Quebec (See Figure 10), this indicates a significant movement to "Outside Quebec" no matter where the "I don't know" respondents end up.

Figure 31 - Choice of Location for Work after Studies ${ }^{45}$ (Q12)

However, the $18 \%$ of respondents who are unsure of where they plan to work outnumber the $14 \%$ of respondents who intend to work outside of Quebec, as well as the respondents from the other regions who currently intend to move to work in the Montreal CMA (shown in Figure 32) is a substantial number. These students are presumably susceptible to persuasion and open to opportunities for employment in Quebec outside the Montreal CMA.

To look at this more closely, we can cross-tabulate the data for the choice of location for work with the permanent address of the respondent. (Figure 32) To clarify how to read this chart, taking respondents with a permanent address in the Montreal CMA, $70 \%$ plan to work in the Montreal CMA, $2 \%$ plan to work in another area of Quebec, $12 \%$ plan to leave Quebec for work while $15 \%$ are unsure. That is, six times as many respondents who live in the Montreal CMA plan to leave Quebec as plan to seek or would consider employment in one of the other Quebec regions. One focus of actions should be to persuade those who plan to leave Quebec to stay, and, perhaps, to work in a region outside the Montreal CMA.

Figure 32 - Choice of Location for Work after Completion of Studies Cross-tabulated with Permanent Address ${ }^{46}$ (Q11 x Q12)

[^20]Similarly, for those with a permanent address in an area of Quebec outside the Montreal CMA, 13\% plan to work in the Montreal CMA, 43\% want to work in Quebec outside the Montreal CMA, 17\% want to leave Quebec to work, and $26 \%$ are unsure. Further, more than four times more respondents with a permanent address outside of Quebec want to work outside of Quebec than in Quebec. This suggests the need for effective measures to retain more students from outside Quebec as well as measures to encourage more students from the Montreal CMA to work in Quebec's regions.

It must be noted, though, that in all cases, the percentages of respondents who are unsure of where they want to work are quite high. If a significant number of these people could be added to the list of those who want to work in the Quebec regions outside of the Montreal CMA, it would make quite a difference.

It is not surprising that the majority or plurality of respondents indicate a preference for working in the area where they have a permanent address, though this is more true of those who live in the Montreal CMA than those in the regions outside of the Montreal CMA. (As we will see in the following section, "friends and family" is the most frequently cited factor in choosing where to work after graduation.)

When the choice of where to work is broken down by program category, this fact is demonstrated as well. (Figure 33) The percentages of those wanting to work in a region of Quebec outside the Montreal CMA are highest in the nursing and social services categories, presumably because the programs are offered there and the students have a permanent address there. This suggests that maintaining and expanding program offerings at English colleges in regions outside of the Montreal CMA might contribute to the retention of English-speaking graduates in those regions.

Figure 33 - Choice of Location for Work after Completion of Studies by Category ${ }^{47}$

Combining the data of nursing program respondents who definitely wish to work in the Montreal CMA and the ones that definitely want to work in other Quebec regions shows that 65\% plan to stay in Quebec. Similarly, $73 \%$ of other health care program respondents and $64 \%$ of social services program respondents plan to work in Quebec. Adding in the number of respondents that are unsure to any of these totals would raise it significantly.

If we examine only those who have a permanent address in Quebec outside of Montreal for where they plan to work after their studies are complete by category, we see that respondents who had to move to the Montreal

[^21]CMA to find the program that they wanted in English (i.e., "Other Health Care"), have a greater tendency to want to work in the Montreal CMA than do those in the other categories. (Figure 34)

Figure 34 - Choice of Location for Work for Respondents from Quebec outside the Montreal CMA ${ }^{48}$

Each of these categories has a high number of respondents who are unsure of where they want to work, suggesting that effective measures encouraging graduates to choose regions other than the Montreal CMA have the potential to effect the choice of locations significantly.

The location in which the respondents are studying (and perhaps doing their internships) shows a similar relationship. (Figure 35) Colleges in the Montreal CMA have a majority of students who want to work there, while those in other regions of Quebec have more respondents that want to work there than to go work in the Montreal CMA or outside of Quebec. At the non-Montreal CMA colleges, more students are contemplating leaving Quebec than establishing themselves in Montreal. (It might be interesting for Heritage and Champlain-Lennoxville to compare the results for their programs to the larger program categories in this respect.)

Figure 35 - Choice of Location for Work Cross-tabulated with Location of College ${ }^{49}$

To examine the influence of main language on this choice, the aggregate data was cross-tabulated with it. (Figure 36) First, $66 \%$ of English-main-language and $69 \%$ of French-main-language respondents plan to stay in Quebec.

[^22]Again, the number of undecided respondents is quite high, suggesting the pertinence of measures to encourage retetnion of graduates in Quebec, regardless of students' main language.

Figure 36 - Choice of Location for Work after Studies Cross-tabulated with Main Language ${ }^{50}(Q 6 \times$ Q12)

On a percentage basis, there is little difference between the those who have either French (52\%) or English (55\%) as their main language and wish to work in the Montreal CMA, and more French-main-language respondents plan to work in a region of Quebec outside the Montreal CMA than do either the English or "Other" language groups. The highest percentage of respondents who want to work in the Montreal CMA are "other"language speakers.

When the 348 respondents who stated that they plan to work outside of Quebec upon completion of their studies are isolated from the others and cross-tabulated with their main language, the results are shown in Figure 37, below.

Figure 37 - Main Language of Respondents who Choose to Work Outside of Quebec after Graduation ${ }^{51}$

The distribution of respondents who intend to leave Quebec for work following graduation by main language is not the same as the overall respondent population. As we saw earlier (Figure 20), 68\% of respondents claimed English as their main language, $18 \%$ of respondents stated that French is their main language and $14 \%$ of respondents identified "other" as their main language. Comparing these numbers to the breakdown of the main languages of those who plan to leave Quebec for work as shown in Figure 37, we see that more anglophones but fewer

[^23]francophones and "other" speakers intend to leave than would have been predicted if the ratios had been the same.

Finally, to see if the imminence of graduation has any effect on the choice of place to work, the data from survey question 2 can be cross-tablulated with that for question 12.

Figure 38 - Choice of Location to Work Cross-tabulated with Graduation within Six Months ${ }^{52}$

There is an increase in the number of respondents who plan to remain in Quebec as they approach graduation (total of $77 \%$ vs $64 \%$ ), a decrease in the number who plan to leave Quebec ( $12 \%$ vs $15 \%$ ), and a decrease in the respondents who have not yet decided what to do ( $11 \%$ vs $20 \%$ ).

[^24]
## Summary of Post-graduate Plans

## - Intention to work in field after completion of studies

- $96 \%$ of respondents in Nursing and the other health care fields plan to work in field
- $79 \%$ of respondents in social services programs intend to work in field
- Plans for further study
- $69 \%$ of respondents plan to go on to university studies
- Highest in Nursing (84\%)
- Lowest in "Other Health Care" (47\%)
- $86 \%$ of those who plan to go to university plan to attend Quebec universities
- 77\% Quebec English university
- $\quad 9 \%$ Quebec French university
- Where to work after completion of studies
- Overall
- $56 \%$ in Montreal CMA
- $12 \%$ in Quebec outside the Montreal CMA
- $14 \%$ Outside Quebec
- $18 \%$ are unsure
- By permanent address
- $70 \%$ of Montreal MCA residents want to work in the Montreal CMA ( $15 \%$ are unsure)
- $43 \%$ of those with a permanent address outside the Montreal MCA want to work outside the Montreal MCA ( $26 \%$ are unsure)
- $50 \%$ of those with a permanent address outside of Quebec want to work outside of Quebec ( $31 \%$ are unsure)
- A greater percentage of respondents who needed to move to the Montreal CMA to find their chosen program in English, ("Other Health Care, 23\%)" chose to work in the Montreal CMA than did those respondents who had the opportunity to pursue their studies in the region where they live (Nursing, $12 \%$ and Social Services, 15\%).
- Respondents who are closer to graduating are more committed to remaining in Quebec and less uncertain about their plans
- A higher percentage of anglophones plan to leave Quebec for work after graduation than do francophones and respondents whose main language is other than French or English.

## VII. Factors that Influence the Choice of Where to Work and Live

The aims of this study were to determine what might improve the retention of graduates in health and social services programs in Quebec, and what might be done to encourage them to work in other regions of Quebec. The groups that need to be influenced are (1) the ones who plan to leave Quebec to work, (2) some number of the ones that want to work in the Montreal CMA and (3) the ones that are unsure of what they want to do.

As we saw in section VI, survey question 12 asked about their choice of place to work following the completion of their studies, and we saw in Figure 31 that $56 \%$ want to work in the Montreal CMA, $12 \%$ wish to work in a region of Quebec outside of the Montreal CMA and $14 \%$ outside of Quebec entirely, while $18 \%$ are unsure. Compare this with the permanent address of the respondents as shown in Figure 10, where we saw that $74 \%$ live in the Montreal CMA, $24 \%$ in another region of Quebec and $2 \%$ from outside Quebec. Adding the "unsure" $18 \%$ to either the Montreal CMA or to a region of Quebec outside of the Montreal CMA would improve retention rates in Quebec. Moreover, if they were added to a region of Quebec outside the Montreal CMA or if some number of graduates who want to work in the Montreal CMA could be encouraged to move to another region of Quebec, the shortage of English-speaking health and social service workers in these regions would be alleviated and the vitality of regional anglophone communities heightened. Knowing the reasons that the respondents chose the place that they said they want to work is a place to start.

## Stated Reasons to Choose a Location for Work after Completion of Studies

Survey question 13 asked them to choose the factors that influenced their choice. Respondents were invited to choose as many factors as applied. In the aggregated data, the two most often-chosen reasons were "Family and friends", and the "Possibility of employment". Note that when "Closer to home", which is where family and friends usually live, is added to "Family and friends", the total is $32 \%$ of all the answers. "Language proficiency" is well behind this, with only $10 \%$.

Figure 39 - Reasons to Choose Location for Work after Completion of Studies (All data) ${ }^{53}$

[^25]The same is not true for respondents that state a preference for working outside of Quebec, for whom "Language proficiency" is the greatest factor at almost three-times the rate of family and friends, though about the same rates as the possibility of employment. (See Figure 40, below.) This seems a clear call for proactive measures to increase access to employment in Quebec's regions, to raise awareness of those regional employment opportunities, and to provide for increased assistance in supplementary French-language proficiency training.

Figure 40-Reasons to Choose Location for Work for those who answered "Outside of Quebec" for Q1254

For comparison, the data for the respondents who said that they do plan to work in Quebec after graduation is shown in Figure 41. Again, the choice is weighted in favor of emotional attachment.

Figure 41 - Reason of Choice for Work for Respondents who Plan to Remain in Quebec ${ }^{55}$

[^26]The choices "Family and friends" and "Closer to home" increase in importance to a total of 38\%. These are essentially the same percentages, whether the respondents wish to work in the Montreal CMA and those who want to work outside of the Montreal CMA. (Figure 42, below.)

Figure 42 - Choice of Location for Work x Reason for Choice of Location for those Remaining in Quebec ${ }^{56}$

When broken down by main language, there are differences among the groups, though the general trend in influencing factors is clear.

Figure 43-Reason for Choice of Workplace Cross-tabulated with Main Language (Q 6) ${ }^{57}$

[^27]The results are also consistent across the program categories. (Figure 44)
Figure 44 - Reason for Choice of Location for Work by Program Category (Q13) ${ }^{58}$

## Factors that Could Encourage Working in an Area of Quebec Outside of the Montreal CMA

Survey question 14 offered the respondent a choice of nine specific factors (as well as an "I don't know" and "Other" choice) that could potentially inspire a graduate of one of the programs in the study to accept work in an area of Quebec outside of the Montreal CMA. They were invited to choose as many factors as were relevant.

Taking the population as a whole, the highest-rated factors were economic ones (total $=36 \%$ ); language proficiency is a cited one-quarter as often as the economic factors (Figure 45).

Figure 45 - Factors that Could Encourage Working in a Region outside of Montreal CMA (All respondents) ${ }^{59}$

[^28]Separating the factors that might encourage working in Quebec outside the Montreal CMA by the choice of location for work (Figure 46) clearly show that for people who would choose to work in the Montreal CMA, the reasons to work in another region of Quebec are again employment and financial reasons. For those who would prefer to work outside of Quebec, possibility of employment and family and friends are the most often cited.

Figure 46 - Choice of Location for Work x Factors that Could Encourage Working in Quebec Outside Montreal CMA (Q12 x Q14) - All Data ${ }^{60}$

When the factors that influence the choice of location for work after completion of studies are broken down by the permanent address of the respondents, we see that for those whose permanent addresses are in the Montreal area, "Possibility of employment" and "Financial reasons" outweigh all the other factors by 2:1 or more. The respondents who have a permanent address in Montreal are probably already close to family and friends, so jobs and financial reasons loom largest for them. (For those whose permanent address is outside Quebec, "Financial reasons" and the "Possibility of employment" are also the top two reasons, though not to as great a degree.) This is not true for those respondents who already live in a region, for whom family and friends are of equal importance with the possibility of employment.

Figure 47 - Factors That Could Encourage Working Outside of the Montreal CMA for those with a Permanent Address in the Montreal CMA or Outside of Quebec ${ }^{61}$ (Q11 x Q14)

The data from respondents who already have a permanent address in Quebec outside the Montreal CMA are difficult to interpret because Question 14 asked if they could be encouraged to move to a place where they already (or may already) have a permanent address. Therefore, Figure 47 omits them.

[^29]Again, jobs or financial reasons would be the most persuasive factors in getting residents of the Montreal CMA to move to another region of Quebec. The preponderance of economic factors suggests that improving recruitment and hiring practices, including proactive measures to hire citizens from the anglophone minority in the public sector, would be the most immediately effective measures to improve retention of English-language graduates.

The relatively lower percentages of respondents citing factors such as "Lifestyle", "Nature", "Culture", and "Community" in Figures 40 through 48 indicate that municipalities, community groups, schools, Chambers of Commerce, and other local groups may have a role in raising awareness of those aspects of working and living in non-metropolitan regions. Promoting the openness and the lifestyle, cultural, and community dimensions of the regions would enhance the attractiveness of the non-Montreal CMA regions .

Of the 561 respondents who gave their permanent address as being in Quebec and outside of the Montreal CMA, 243 (43\%) said that they will choose to work in Quebec outside of the Montreal CMA; it is not possible to know if they mean in the same region as their permanent address or are amenable to moving to some other region. That leaves 74 (13\%) who would choose to work in the Montreal area, 98 (17\%) who want to work outside Quebec and 146 (26\%) who do not know or to whom this is not applicable. Here, too, increasing access to employment opportunities would probably be the most effective way to retain graduates in Quebec's regions.

When the factors that could encourage respondents to work in a region outside of the Montreal area are crosstabulated with main language, very little difference is shown. The exception to this in the lower level of the importance of language proficiency for those whose main language is French, which causes the percentages in the other categories to be increased. (Figure 48)

Figure 48 - Factors Encouraging Location of Work Outside of the Montreal CMA Cross-tabulated with Main Language ${ }^{62}$

Looking at all the data for this question in general, we see that family, friends, jobs and financial concerns are consistently at the top of the list, despite the respondents main language.

## Degree to which Respondents MIGHT be willing to Establish Themselves outside of the Montreal CMA

To assess the extent that structures or incentives could be successful in persuading graduates in the health and social services fields to seek employment in regions of Quebec outside the Montreal CMA, they were asked to

[^30]indicate the degree to which this might be so. (Figure 49) An average of $33 \%$ indicated that they were willing, $38 \%$ said that they might be persuaded and $8 \%$ were unsure. Only $21 \%$ said that they were not amenable to this.

Figure 49 also shows that this is not evenly distributed, but also begs the question of what this willingness means to respondents who already live in a region of Quebec outside the Montreal CMA. Does it mean only the region where they currently live, or any other region of Quebec?

Figure 49 - Degree of Willingness to Consider Employment in a Region of Quebec outside the Montreal CMA by Permanent Address (Q $11 \times$ Q15) ${ }^{63}$

Figure 50 (below) breaks this down by program category as well. If the "yes" and "maybe" answers are combined, the "Nursing" and "Other Health Care" program respondents gave about the same total (69\%), while the "Social Services" program category had a total of $76 \%$. The "No" group is the smallest in each program category.

Figure 50 - Degree of Willingness to Consider Employment in Region of Quebec outside of Montreal by Category ${ }^{64}$ (Q15)

When cross-tabulated with main language (Figure 51), we see that the respondents with French as their main language expressed the highest degree of willingness to consider employment outside of the Montreal CMA; it is again true that the "Maybe" answers nearly equaled or exceeded the "Yes", and that the "No" answers are the lowest on a percentage basis.

[^31]Figure 51 - Degree of Willingness to Consider Employment in Region Outside of Montreal Cross-tabulated with Main Language (Q15 x Q6) ${ }^{65}$

[^32]
## Summary of Factors that Could Influence the Choice of Where to Work after Graduation

- Reasons to choose a location for work after completion of studies
- Overall, the top two reasons are "Family and friends" and "Possibility of employment", 17\% each. Language proficiency is fairly far down the list at $10 \%$.
- For the groups that plan to work in Quebec, the top two reasons for choosing a location are "Family and friends" and "Closer to home".
- The top reason for the choice of location for work for the group that plans to leave Quebec to work is "Language proficiency," at $22 \%$, the highest percentage received by any of the factors cited as a factor influencing post-graduation location of work.
- When all data for "Family and friends" is added to "Closer to home", that total becomes 32\%.
" When "Possibility of employment" and "Financial reasons" are combined, the total is 24\%.
- There is little or no difference by main language or program category.
- Factors that could encourage working in a region of Quebec outside the Montreal CMA
- Overall, jobs and other financial reasons are the top two factors that could influence moving to a region outside the Montreal CMA for work.
- For those who plan to work in Montreal CMA, jobs and financial reasons are at the top of the list as well.
- For those who plan to work in another region of Quebec, jobs and friends \& family are the top two reasons.
- For those who plan to leave Quebec for work, financial reasons and jobs are the most important.
- For respondents who have a permanent address in a region of Quebec outside of the Montreal CMA but who plan to leave their region for work, family \& friends and jobs are the reasons that could encourage them to remain in their region.
- Main language has very little effect on the results for this question.
- Lifestyle, community, culture, and nature are factors that seem to register less frequently with respondents.
- Degree to which respondents might be willing to establish themselves outside of the Montreal CMA
- Overall
- $70 \%$ were either willing or might be willing
- $22 \%$ said they were not willing
- $8 \%$ were unsure
- There is variation when the data is split up by program category.
- Social services program category shows the highest degree of willingness.
- The Nursing and Other Health Care categories are about equal.
- The respondents with French as their main language have the highest degree of willingness to move to a region of Quebec outside of the Montreal CMA.

## VIII. Self-Assessment of French-Language Skills

Since the surveys were of students in health and social science programs at English-language colleges, their ability to serve clientele in English is taken for granted. However, to work effectively at and live comfortably near health and social service institutions in all areas of Quebec, especially outside the Montreal CMA, a high degree of skill in the French language is required.

In examining the data related to the respondents' self-assessment of their ability to function in French in the workplace, it is useful to recall the information shown in Figure 20. First, that $68 \%$ of respondents declare English as their main language, while $18 \%$ claim French and $14 \%$ say "another language". When asked about the language that they use most in daily life, English increases to 82\%, "other" decreases to only 1\% and French remains largely unchanged at $16 \%$.

## Respondents' Skills in Writing, Speaking and Reading French

Question 8 of the survey asked the respondents to assess their adequacy in writing, speaking and reading in French for the health and social services workplace after graduation. (Figure 52) Overall, 70\% either strongly agreed or agreed with the statement, "I feel that my written French is adequate for the Health and Social Services workplace after I graduate". Eighty-three percent (83\%) strongly agree or agree with a similar statement concerning spoken French, and $87 \%$ strongly agree or agree with a similar statement concerning reading French.

Figure 52 - Summary of Respondents Level of Agreement with Statements the Adequacy French for the Workplace ${ }^{66}$

Breaking this down one skill at a time by program category shows some variability. (Figure 53) The sum of "Strongly agree" and "Agree" for written French is greatest in "Other Health Care" (78\%) and weakest in "Social Services" (61\%). This holds true of spoken French and reading in French (Figure 54, Figure 55).

[^33]Since French proficiency may vary by individual program and college, faculty, program coordinators, and college administrators will need keep this in mind when comparing results for their programs to this report's aggregated results and developing responses to the report for their programs.

Figure 53 - Strongly Agree + Agree for Written French by Program Category ${ }^{67}$

Figure 54 - Strongly Agree + Agree for Spoken French by Program Category ${ }^{68}$

Figure 55 - Strongly Agree + Agree for Reading French by Program Category ${ }^{69}$

[^34]The next three figures compare the respondents' assessments of their skills in French cross-tabulated with declared main language. Naturally, respondents who have French as their main language are more confident about working in French in general than are the anglophones and "others". However, the levels of those with English or "other" as their main language are also fairly high, with written French being the most difficult for everyone.

Unsurprisingly, francophones are most confident in their abilities in written French, with the "Strongly agree" category being more than two times larger than the "Agree". (Figure 56) The total of these two categories for francophones is $94 \%$, though only two-thirds of French-main-language respondents "strongly agree" that their written French is adequate.

This relationship is reversed for English-main-language respondents. Even though the total of "Strongly agree" and "Agree" for anglophones is $65 \%$, there are 2.6 times fewer in the "Strongly agree" category.

For the "Other" main-language respondents, there are also fewer in the "Strongly agree" category, but by a smaller margin (1.5); the total of "Strongly agree and agree for them is $66 \%$, which is equal to that of the anglophones.

Figure 56 - Adequacy of Written French Cross-tabulated with Main Language (Q8.1 x Q6) ${ }^{70}$

Almost no French-main-language respondents are in the "Disagree" and "Strongly disagree" categories. However, of English-main-language respondents, $23 \%$ disagree and $9 \%$ strongly disagree that their written French is adequate to allow them to work in a French environment. These $32 \%$ could surely benefit from enhanced language training and support to encourage them remain and work in Quebec, along with the $27 \%$ of "other" speakers who are in the "Disagree/Strongly disagree" category.

It is perhaps surprising that there are more "other" language respondents in the "Strongly agree" category than anglophones, and fewer in the "Disagree/Strongly Disagree" ones. This may be due to the increased likelihood of them being immigrants to Quebec and having gone to French-language primary and secondary schools.

The findings for spoken and reading French are similar to those for written French for francophones and anglophones in that the francophones are more confident than the anglohones, and that the confidence levels are higher in all categories than for written French. (Figure 57, Figure 58)

However, "other" main language speakers are less likely to say that they agree that their spoken (Strongly agree + Agree $=72 \%$ ) or reading (Strongly agree + Agree $=82 \%$ ) French is adequate for work than are anglophones ( $81 \%$

[^35]and $85 \%$ respectively). They are also more likely to disagree or strongly disagree with the statement concerning spoken French (24\%) than the English-main-language respondents (16\%).

While these positive "Agree" plus "Strongly agree" results are encouraging, the "Disagree" plus "Strongly disagree" results, which could vary considerably by individual program, indicate that additional French as a Second Language (FSL) support is needed to enable the retention of English-speaking graduates, as well as graduates whose main language is other than English or French.

Figure 57 - Adequacy of Spoken French Cross-tabulated with Main Language (Q8.2 x Q6) ${ }^{71}$

Figure 58 - Adequacy of Reading French Cross-tabulated with Main Language (Q8.3 x Q6) $)^{72}$

[^36]It might be suspected that respondents who live in Quebec outside of the Montreal CMA would be more confident in their abilities to work in French, but when their permanent addresses are cross-tabulated with the answers of survey question 8, this is not shown to be the case. (Figure 59) It could be argued that some respondents who live in a region outside of Montreal CMA have a more realistic view of their abilities than those in the Montreal CMA.

Figure 59-\% Strongly Agree + Agree with Adequacy of French Cross-tabulated with Permanent Address (Q11 x Q8) ${ }^{73}$

Separating the respondents who were anticipating completing their program within six months (in year three of the program) from those who were not, shows an increase in the numbers who either strongly agree or agree with the adequacy of their written, spoken and reading French. (Figure 60) Students who are nearing graduation may have had their confidence in their abilities to function in French in the workplace boosted by their experiences in internships, as well as by having taken more FSL courses.

Figure 60-Adequacy for French for Workplace Cross-tabulated with Anticipation of Graduation ${ }^{74}$

[^37]
## French Second Language Courses

Because all of the programs covered in the surveys lead to a Diplôme des études collegiale, they require the attainment of the competencies usually associated with two FSL courses in the General Education component of the program, the second of which is program specific. Exemptions or substitutions for these competencies may be granted, but they must be attained in order to graduate. The course grids for these programs likely have the required French courses in the first two years, and since $27 \%$ of the respondents expected to graduate in the next six months and the other $73 \%$ are completing either the first or second year of their program, it is not surprising that an average of $86 \%$ of the respondents answered "yes" to the question of whether they have taken any French courses at the college level. Another 6\% of the respondents said that there was no need for them to take French Second Language (FSL) courses because they were granted exemptions or substitutions for courses that they took in other programs or institutions that are not CEGEPS. (Figure 61)

Figure 61 - Percentage of Respondents Who Have Taken French Courses at the CEGEP Level by Program Category (Q9) ${ }^{75}$

Even though there are two required FSL courses in all DEC programs ${ }^{76}$, they are not the same two FSL courses. Different second-language courses are offered to accommodate the different skill levels of the entering students. Hence the designations Level 1, Level 2, Level 3 and Level $4 .{ }^{77}$

Survey question 10 asked about the highest level of FSL completed at the college level. Figure 62, below, crosstabulates these results with the main language of the respondent. (The six percent of respondents from Figure 61 that chose "Not applicable" to the question of having taken French at college, would likely answer "NA" to question 10 , so the data for that choice is difficult to interpret.)

[^38]Figure 62 - Last Level of FSL Completed Cross-tabulated with Main Language of Respondent (All Data, Q10)) ${ }^{78}$

As expected, respondents whose main language is French are concentrated in the more advanced FSL courses. Looking at the level of FSL taken, those with English as their main language achieve a majority when levels 2 and 3 are combined. Notably, more respondents whose main language is other than French or English have taken level 4 FSL courses than have English-language students, possibly because many of those other students have gone to French elementary and secondary schools. Acknowledging that different colleges have different names for the FSL levels (e.g., French 100 = B block 200 = Level 1 French) Question 10 was clarified in the 2020 version of the survey. Consequently the 2020 data was probably more accurate and the results more representative for this question, though much room for misunderstanding remains. (Figure 63)

Figure 63 - Last Level of FSL Completed Cross-tabulated with Main Language of Respondent (Q10, 2020 Data Only) ${ }^{79}$

[^39]Since a large number of respondents are unaware the highest level of French taken ${ }^{80}$, (or the question does not apply to them), for ease of comparison, Figure 64 omits those in the "I don't know/NA" category.

Figure 64 - Last Level of French Completed Cross-tabulated with Main Language Excluding Data for Respondents who Do Not Know/NA (Q10, 2020 Data Only) ${ }^{81}$

By way of explanation, the general education component of all DEC programs requires the attainment of competencies generally achieved by successful completion of two second language courses. At French colleges, this means English-second-language and at English colleges, it means courses in FSL. The first course in any level is intended to be common to all, and the second one, to be specific to the program of the student.

The relative weakness of anglophones, shown by the $46 \%$ that are found in mise à niveau, level 1 and level 2 courses, argues for increased support for French-language training. Similarly, 39\% of "other" main language respondents are at these low levels and would also benefit from increased language support.

[^40]
## Summary of Self-assessment of French Language Skills

- While only $18 \%$ of respondents declare French as their main language,
- $70 \%$ of respondents either strongly agree or agree with the statement that their written French is adequate for the health or social services workplace in Quebec.
- $83 \%$ of respondents either strongly agree or agree with the statement that their spoken French is adequate for the health or social services workplace in Quebec.
- $87 \%$ of respondents either strongly agree or agree with the statement that their ability read French is adequate for the health or social services workplace in Quebec.
- Respondents in the "Other Health Care" category are consistently somewhat higher than the average in their self-rating of written, spoken and reading French while respondents in the "Social Services" category are consistently somewhat lower than the average in their self-rating of written, spoken and reading French.
- Respondents who are within six months of graduation have a higher level of confidence in their ability to work in French than do those who are at an earlier stage in their program, perhaps due to increase exposure during their internships.
- Most respondents, being at a minimum in the second semester of their program, have taken FSL courses at the college level.
- FSL courses are geared to the skill level of the entering student and go from entry level up through level four. The relative weakness of English-main-language respondents is evidenced by their large numbers in Levels 1 and 2 of FSL courses among anglophones and "other" main language respondents. This argues for additional training in French for a significant portion of the students.

## IX. Conclusions, Comments and Recommendations

The project was an operational success: the research team obtained the cooperation of all the colleges involved, methods were found to carry out the survey at all locations and data was securely accumulated for both survey years at the bench-mark rate of $60 \%$ response rate. This data was shown to be internally consistent and allowed for the painting of a picture of the respondents, as well as a degree of confidence in the results and the conclusions that may be drawn from them.

The first of the three areas that the project looked at was that of the postgraduate plans of the respondents. Most intend to work in their field after they complete their studies, be that college or university. The majority do plan to go on to university studies and to do so in Quebec. As to where they plan to work, the largest number want to stay within the area where they have a permanent address, though a greater percentage of those who needed to move to the Montreal CMA to find their program in English want to stay there to work than for the other categories.

The second area of study for the project was what influences the respondents' choice of where to work. Overall "friends and family" and "the possibility for employment" are the top two factors, while "being closer to home" is third. This is independent of main language spoken or program category. Language proficiency is much further down the list. Adding up the emotional ties factors vs. the economic ones, the emotional ties win out $32 \%$ to $24 \%$.

Looking at the factors that could induce someone who has a permanent address in the Montreal CMA or outside of Quebec to move to another region of Quebec for work, jobs and financial reasons are the clear winners. Since the survey did not make clear the definition of "region" for the respondents who already have a permanent address in Quebec outside the Montreal CMA, it is difficult to interpret questions that ask respondents who already live in a region outside of the Montreal CMA about moving to a region outside of the Montreal CMA . (What does "region outside of the Montreal CMA" really mean in this context? The colleges in the study outside of Montreal are in l'Estrie ( 1.75 hours from Montreal) and l'Outaouais ( 2.25 hours from Montreal and a bridge away from Ontario). Moving to or staying in those areas for work is not the same as moving to Abitibi, Sept-Iles, Saguenay, Gaspé or the Lower North Shore.)

In all cases, there is a high degree of uncertainty about where to live following work. Coupling this with a degree of willingness to consider moving outside of the Montreal CMA for work indicates that a number of respondents are available to be persuaded.

There are two main groups that might be recruited to increase health and social services in English in the regions: the students who reside in the Montreal CMA who are already enrolled in pertinent career programs and those from outside the Montreal CMA that could be.

Of the first group, programs offering professional, personal, linguistic and financial support for students doing internships in the regions outside of the Montreal CMA could increase the comfort-level of the students and allow the establishment of local relationships. This would be important for most students from the English-speaking minority, but perhaps especially for anglophone or other-main-language students who are also visible or ethnic minorities. This would encourage the acceptance of employment there, solving both their retention in Quebec and improving the access to services in English.

There are several possible paths to increase the number of students from regions outside of the Montreal CMA in programs that exist only in English in the Montreal area.

One way to increase the number of students from other regions in programs that exist only in the Montreal CMA in English might be to offer them financial support to do so ${ }^{82}$. This could be coupled with support for the colleges that would be doing the recruiting.

[^41]A second way could be to have English-speaking students from other regions complete the General Education portion of their program via partnerships with colleges where they live, and then to travel to Montreal for their career-specific courses; this would reduce both the financial burden and the portion of time away from friends and family, and help maintain ties to their home area. It could also help Montreal colleges deal with space and enrollment limitations that they face, while also maintaining enrolment at regional colleges.

A third way would be to have students from regions outside of the Montreal CMA complete their general education in English at a local college and receive the professional portion of their training in partnership with a local French cegep. This would assist with integration into local institutions and encourage the improvement of French-language skills.

A fourth way would be to increase the program offerings at the colleges that offer English education in the regions outside of Montreal. ${ }^{83}$ Both of these would keep the students in the regions where they live.

According to the survey results, language is only a problem for those who come from outside Quebec (which is only $2 \%$ of respondents), and for a significant minority of those who already live here. A majority of respondents believe that their French is adequate for the workplace, with written French being weaker than the spoken or reading. However, given that $46 \%$ of anglophones are studying or have studied French in their cegep program at a fairly low level, it seems clear that support for improvement in French would be needed.

More extensive contact with local environments where there is an identified need for services in English, perhaps through satellite campuses of colleges that already give these programs could help to foster local ties and encourage consideration of accepting employment there in those who are not from there.

More internships in French-language institutions in the regions coupled with increased language support could also improve the confidence among those who feel less than fully able to take on working there. Also, encouraging health and social services career-program graduates who plan to continue their studies to do so at Frenchlanguage universities would improve their French-language skills and might make them more likely to remain in Quebec.

Since the main reasons that respondents chose where to work were "Family and friends" and "Closer to home, recruitment of students in communities where there is an identified need for English services coupled with innovative methods of delivering the competencies required and appropriate financial support would enable the graduate to return to that community following graduation.

When asked about factors that could encourage working in an area of Quebec outside the Montreal CMA, "Possibility of employment" and "Financial reasons" were the top two cited. Presumably, a job that pays well enough to compete with the lure of a life in Montreal or outside Quebec would lead some anglophones to remain in Quebec and relocate to another region of the province.

In any case, this survey indicates that there are a number of opportunities to improve the access to Englishlanguage health and social services though the retention and relocation of the graduates of health and social services career programs from English-language colleges.

[^42]
# Appendix A - Survey Questions 

## Survey on Your Motivation to Stay in Quebec

## Consultation in anonymous mode

Thank you for taking the time to complete the survey on where you plan to work post-graduation.

The purpose of this survey is to identify the drivers that motivate English-speaking Cegep students in choosing where they will work after graduation. This survey is being administered to all Health and Social Service students in participating Quebec Anglophone Cegeps. The information gathered will influence decisions made by the programs and the Cegeps, as well as at the provincial government level. In responding to this survey, your thoughts together with the responses from other students will provide important information on this question.

This survey is administered by your college with the approval of your Academic Dean and Program Dean. The information from all Cegeps will be aggregated by John Abbott College. It is important to emphasize that participation is voluntary, anonymous and that all personal information is confidential. If any of your comments are used, they will not be associated with you personally.

Please note that by completing this survey, you are agreeing to participate in this study: "I understand that my participation is voluntary, I may withdraw from participation at any time, and my academic standing will NOT be affected in any way by consenting or not consenting to participate in the study."

Your participation is limited to the completion of the following survey. Completion of this survey should take less than 5 minutes. If you have any questions or concerns related to this survey, please contact Lisa Boyle at the College Development Office by email at lisa.boyle@johnabbott.qc.ca.

## STUDENT INFORMATION

1. Which Health or Social Service program are you currently registered in?
(Check list of particular college's programs)
2. Do you expect to graduate from this program within the next 6 months? $O$ Yes $O$ No

## EDUCATION

3. Why did you choose to attend an English-language Cegep? Choose all that apply.

O Proximity
O Linguistic-cultural identity
Opportunity to study in English
O Program and course offerings
O Other (please specify)
4. Once you have completed all of your studies (Cegep and/or university), do you plan to work in the field of health or social services? O Yes O No Ol don't know
5. If you are considering attending university, what type of university would you choose?

O English-language in Quebec
O French-language in Quebec
O English-language outside of Quebec
O French-language outside of Quebec
O I do not plan on attending university
O I do not know
O Other (please specify)

## LANGUAGE

6. Regardless of the languages you speak, which do you consider your main language?

Onglish
O French
O A language other than English or French
7. Which of these two languages, English or French, do you use most often during your day-to-day activities?

Onglish
O French
O Neither
8. Please respond to the questions below:

O Strongly agree O Agree O Disagree O Strongly disagree OIdon't know/Not Applicable
8.1 I feel that my WRITTEN French is adequate for the Health and Social Services workplace after I graduate.
8.2 I feel that my SPOKEN French is adequate for the Health and Social Services workplace after I graduate.
8.3 I feel that my French READING is adequate for the Health and Social Services workplace after I graduate.
9. Have you taken any French as a second language courses at Cegep (either as part of your current program or not)?

O Yes
O I have not yet taken any French as a second language courses at Cegep.
O I did not need to take French as a second language courses (received substitutions or equivalencies.
10. If yes, what was the last level of French you completed? (in the 2019 Survey)

O Mise à niveau
O Level 1
OLevel 2
OLevel 3
O Level 4
O Not Applicable/I do not know
10. If yes, what was the last level of French you completed? (in the 2020 survey)

O French 009 \Mise à niveau
O French $100 \backslash$ B block $200 \backslash$ Level 1 French
O French 101 \B block 201 \Level 2 French
O French $102 \backslash$ B block 202 \Level 3 French
O French 103 \B block 203 \Level 4 French
O Not Applicable/I do not know

## POST-GRADUATION PLANS FOR WORK

Please use this list to answer questions 11 and 12.
The CENSUS METROPOLITIAN AREA OF MONTREAL INCLUDES THE ISLAND OF MONTREAL AND THE FOLLOWING OFF-ISLAND CITIES AND TOWNS:

| Beauharnois | Beloeil | Blainville |
| :--- | :--- | :--- |
| Boisbriand | Bois-des-Filion | Boucherville |
| Brossard | Candiac | Carignan |
| Chambly | Charlemagne | Châteauguay |
| Coteau-du-Lac | Delson | Deux-Montagnes |
| Gore | Hudson | La Prairie |
| L'Assomption | Laval | Lavaltrie |
| L'Épiphanie | Léry | Les Cèdres |
| Les Coteaux | L'Île-Cadieux | L'Île-Perrot |
| Longueuil | Lorraine | Mascouche |
| McMasterville | Mercier | Mirabel |
| Mont-Saint-Hilaire | Notre-Dame-de-l'île-Perrot | Oka |
| Otterburn Park | Pincourt | Pointe-Calumet |
| Pointe-des-Cascades | Repentigny | Richelieu |
| Rosemère | Saint-Amable | Saint-Basile-le-Grand |
| Saint-Bruno-de-Montarville | Saint-Colomban | Saint-Constant |
| Sainte-Anne-des-Plaines | Sainte-Catherine | Sainte-Julie |
| Sainte-Marthe-sur-le-Lac | Sainte-Thérèse | Saint-Eustache |
| Saint-Isidore | Saint-Jean-sur-Richelieu | Saint-Jérôme |
| Saint-Joseph-du-Lac | Saint-Lambert | Saint-Lazare |
| Saint-Lin-Laurentides | Saint-Mathias-sur-Richelieu | Saint-Mathieu |
| Saint-Mathieu-de-Beloeil | Saint-Philippe | Saint-Placide |
| Saint-Sulpice | Saint-Zotique | Terrasse-Vaudreuil |
| Terrebonne | Varennes | Vaudreuil-Dorion |
| Vaudreuil-sur-le-Lac | Verchères |  |

11. Where do you consider to be your permanent address? (Please note the Census Metropolitan Area of Montreal includes the Island of Montreal as well as the cities and towns indicated above:

O Within the Census Metropolitan Area of Montreal (see list above)
O In Quebec but outside of the Census Metropolitan Area of Montreal
O Outside of the province of Quebec
12. Where is your location of choice for work after the completion of your studies (Cegep and/or university)?

O Within the Census Metropolitan Area of Montreal (see list above)
O In Quebec but outside of the Census Metropolitan Area of Montreal
O Outside of Quebec
O I do not know
13. Why would you choose this location for work after the completion of your studies? Check all that
apply:
O Family/Friends
O Community
O Possibility of employment
O Lifestyle
O Financial reasons
O Closer to home
O Culture
O Language proficiency
O Not Applicable/I do not know
O Other (please specify)
14. Which of the following factors COULD encourage you to consider working in an area of Quebec outside of the Census Metropolitan Area of Montreal? Check all that apply:

O Family/Friends
O Community
O Possibility of employment
O Nature
O Lifestyle
O Financial reasons
O Closer to home
O Culture
O Language proficiency
O Not Applicable/I do not know
O Other (please specify)
15. MIGHT you be interested in establishing yourself in a region of Quebec outside of the Census Census

Metropolitan Area of Montreal?
O Yes
O No
O Maybe
O Not Applicable/I do not know

VERY IMPORTANT!!! Don't forget to click on the Continue button to review your answers and confirm your participation on the next page.

## Appendix B－Tabulated Data from the 2019 Survey

[^0]:    ${ }^{1}$ In this report, the term "Montreal CMA" refers to the Census Metropolitan Area of Montreal as defined in the survey reproduced in Appendix A.
    ${ }^{2}$ Champlain-Lennoxville College, Champlain-St. Lambert College, Dawson College, Heritage College. John Abbott College and Vanier College
    ${ }^{3}$ Appendix A contains a copy of the survey.

[^1]:    ${ }^{4}$ See Table I at https://www150.statcan.gc.ca/n1/pub/89-657-x/89-657-x2019011-eng.htm
    ${ }^{5}$ https://www.mcgill.ca/dialoguemcgill/
    ${ }^{6}$ Career programs are distinct from pre-university programs. They both lead to a DEC (Diplôme d'études collégiales), but career programs are planned to take six semesters rather than four to complete; all these programs have a significant percentage of graduates that take longer to complete than what is anticipated. They generally have workplace internships and are intended to be terminal, leading to employment upon graduation. However, many students intend to pursue further studies, and some programs prepare their graduates to enter DEC/BAC programs at Quebec universities.

[^2]:    ${ }^{7}$ Career programs are three-years in duration, have a general education component and lead to a Diplôme d'études collégiales; therefore, the students surveyed would be a mixture of first, second, third year (and, in calendar years, higher) students.
    ${ }^{8}$ The first region is the Census Metropolitan Area of Montreal (Montreal CMA). (See Appendix A of this report for the list of the cities and towns included.) The two others are the official administrative regions of I'Estrie and I'Outaouais.
    9 The exception to this was survey question 10, concerning the last level of French taken. This question was clarified in the 2020 survey to match the terms used to describe the levels of French at different colleges. A copy of the survey questionnaire is found in Appendix A of this report.

[^3]:    ${ }^{10}$ Skytech Communications is a Quebec company that created and manages a number of services used by many educational institutions in Quebec and elsewhere. In addition to the efficiency and consistency noted above, another advantage of the Omnivox survey module is that the potential respondents see a reminder that there is a survey to complete each time they open their Omnivox interface.

[^4]:    ${ }^{11}$ The open-source on-line survey application LimeSurvey, housed on the John Abbott College servers was used to query the students at Vanier College. Vanier students were sent a link to the survey by the coordinators of their respective programs via a Mio, which is Omnivox's internal email program. Using LimeSurvey has the advantage of storing the data directly at the place it will be processed, but the disadvantage of the lack of automatic reminders to complete the survey.

[^5]:    ${ }^{12}$ With the exception of the number of students registered in each program, which was provided by the colleges themselves, and the name and location of each college, there is no independent verification data available.
    ${ }^{13}$ Figures 2,3 and 4 were compiled from registration information supplied by the participating colleges and raw survey data, tabulated first in Appendices B, C, D \& E of this report.
    ${ }^{14}$ As an example: Pazzaglia, A. M., Stafford, E. T., \& Rodriguez, S. M. (2016). Survey methods for educators: Analysis and reporting of survey data (part 3 of 3) (REL 2016-164). Washington, DC: U.S. Department of Education, Institute of Education Sciences, National Center for Education Evaluation and Regional Assistance, Regional Educational Laboratory Northeast \& Islands. Retrieved from http://ies.ed.gov/ncee/edlabs.

[^6]:    ${ }^{15}$ Community Recreation Leadership Training, Social Service, Special Care Counselling, and Youth and Adult Correctional Intervention are the "Social Services" programs. Biomedical Laboratory Technology, Dental Hygiene, Diagnostic Imaging, Nursing Intensive, Paramedic Care Physiotherapy Technology, Radiation Oncology and Respiratory \& Anesthesia Technology make up the "Other Health Care" category.
    ${ }^{16}$ These numbers are for both years of the survey combined.

[^7]:    ${ }^{17}$ Appendix E, Table E3
    ${ }^{18}$ Appendix E, Table E2
    ${ }^{19}$ One noted difference comes from the addition of the data from a Montreal CMA college. This explains the increase in the number of students claiming a permanent address in Montreal CMA and the choice to live in and work in Montreal CMA after completion of studies.

[^8]:    ${ }^{20}$ Appendix E, Table E3
    ${ }^{21}$ Appendix E, Table E15. It is important to remember that the "Outside Quebec" group is made up of only 54 respondents out of 2382; this needs to be kept in mind when looking at them as a separate group. Not including them in anything after the initial analysis was given serious consideration but in the end, all the data was included.

[^9]:    ${ }^{22}$ A further distortion in the data could arise from the fact that Vanier students did not participate in the 2019 survey. They were included in the 2020 survey, but even so, their response rate was quite low. By registration numbers, Special Care Counselling was $31 \%$ of the total for social services programs in 2020, and Vanier's program was $64 \%$ of that number. Extrapolating similar numbers back to 2019, it is clear that due to this the social services program count is low overall and the percentages inflated for the regions outside the Montreal CMA. However, most data are presented as percentages, which should blunt the effect of that on the results. This shows up again in Figure 12.
    ${ }^{23}$ Appendix E, Table E15. These are percent totals for the category.
    ${ }^{24}$ Appendix E, Table E15. These are percent totals for the permanent address.

[^10]:    ${ }^{25}$ Source: registration information provided by participating colleges (Appendix E, Table E1) and Survey Question 11,
    ${ }^{26}$ Appendix H, Table H3

[^11]:    ${ }^{27}$ Appendix H, Table H12. Remember that Vanier College did not participate in the 2019 survey and that they offer Special Care Counselling, one of the Social Services programs.
    28 Appendix I-Table I 16. Note that this only includes the students registered in the colleges in the regions.
    ${ }^{29}$ Please note that in all Cegep programs high percentages, often higher than 50\%, of students take more than the two or three calendar years theoretically required to complete their programs.

[^12]:    ${ }^{30}$ Appendix E, Table E4
    ${ }^{31}$ Data found in Appendix E, Table E5. Question 3 allowed respondents to choose all reasons that applied.

[^13]:    ${ }^{32}$ A note on "other" answers: This choice was provided to allow unusual reasons to be collected. One-hundred-and-twentyseven (127) (5\%) of the respondents typed in an answer. In reality, $60 \%$ of those were explanations of the various reasons they wanted to study in English, which the respondents had already checked. The remainder mentioned the specific program or college, wanting to play sports, being with their friends or the costs being lower. These numbers were very small and none of them would change the outcomes, especially when split into the three categories; neither do they speak in any broad fashion to the purposes of the surveys. Therefore, they were not coded and included in these or subsequent totals.

    ${ }^{76}$ Whether at French-language or English-language colleges, the "mother-tongue" language courses - the language of the college - are the same for all the students; this is generally true regardless of the skill level of the student. The "secondlanguage" courses have different levels into which the students are placed.
    77 Mise à niveau courses are non-credit, and are offered to those whose French is too weak to study at Level 1. After this course is completed, the student will go on to enroll in a Level 1 credit course.

[^39]:    ${ }^{78}$ Appendix G, Table G11.
    ${ }^{79}$ Appendix G, Table G17

[^40]:    ${ }^{80}$ It is the experience of the authors that this is quite typical.
    ${ }^{81}$ Appendix G, Table G18

[^41]:    ${ }^{82}$ For the regions l'Outaouais and l'Estrie, this could include recruitment to the Nursing and Special Care Counselling programs currently offered at Heritage College and Champlain-Lennoxville College.

[^42]:    ${ }^{83}$ In addition to Champlain-Lennoxville and Heritage College, Champlain-St. Lawrence is an English college in the National Capital region, while both Cegep de la Gaspésie and Cegep de Sept-Iles have English sections. All these colleges could expand their program offerings.

[^43]:    84 "Other" answers omitted.
